Wire Mesh Memo Board DIY

Last updated 30 July 2026

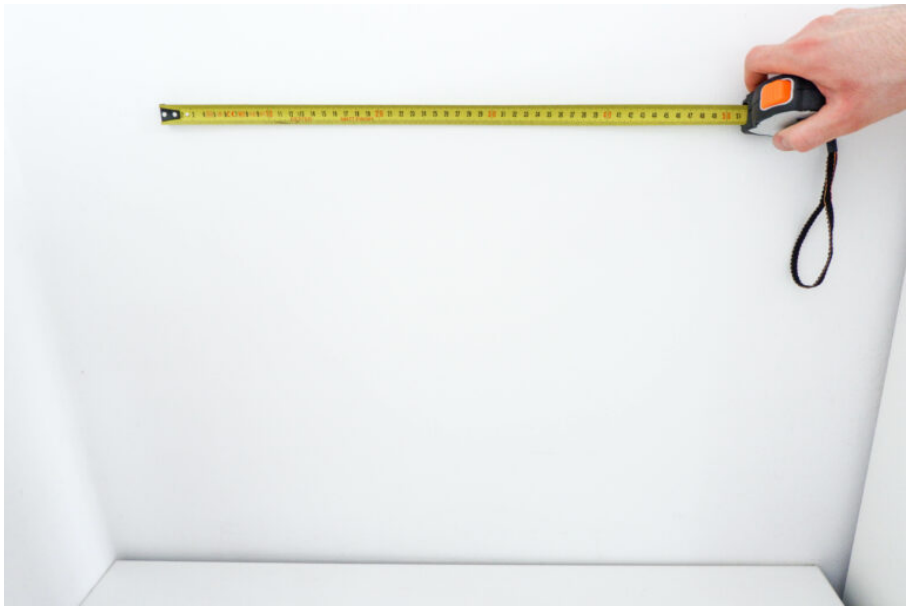

In this post you will find out how to turn an ordinary mesh panel into a wire mesh memo board DIY style.

OVERVIEW:

- **Estimated Completion Time:** ~30 minutes
- **Experience Required:** Low
- **Tools Required:** Drill (Electric Screwdriver) or Hammer, Spray Paint (we used matte black)
- **Materials Required:** Mesh Panel, Screws

STEP 1) Get the Right Size Panel

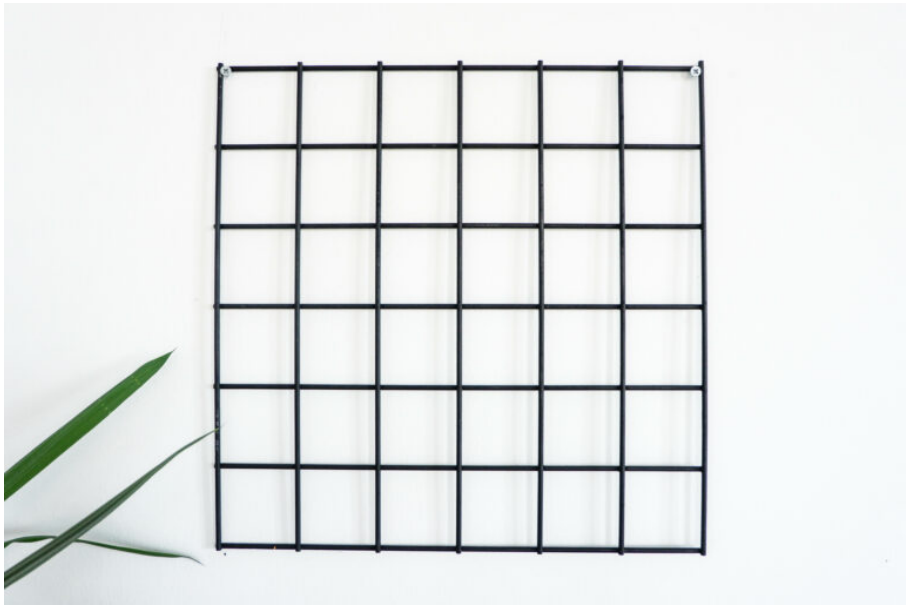

- Measure the space that you have free for the panel.
- Purchase the right size, or if you are only able to purchase a bigger panel, cut it to size.

STEP 2) Paint the Mesh (Optional)

- Use a spray paint suitable for metals and follow the instructions on the label to paint the panel.
- Once painted, let it dry before hanging it on the wall.

STEP 3 – METHOD A) Hang the Grid on the Wall with Screws

- You can hang the grid with many different methods. The easiest is using screws.
- Drive 2 screws into the wall – one at each of the top corners of the panel and hang the board on them.

STEP 3 – METHOD B) Fit the Grid into the Desired Space

- Another easy way is to stand it up on your desk.
- Make sure that you place it on a non slippery surface so it doesn't fall when decorated.

Step 4) Decorate the Grid

- You can hang anything on the mesh with simple clothespins or clips.
- From notes to photos and other memories, such as tickets, festival bracelets and more... the possibilities are endless and the only limit is your imagination.

TIPS

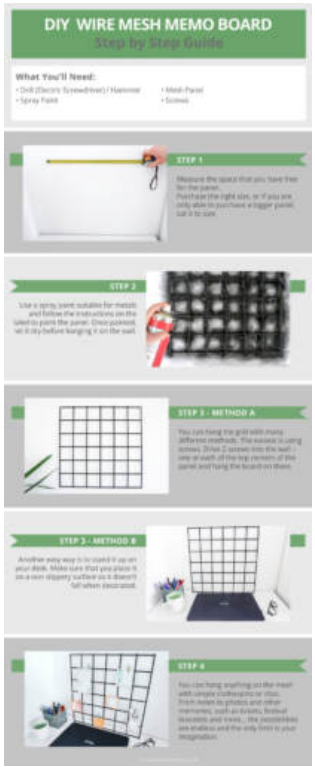

- You can use a metal primer before applying the coloured paint in order to have a smoother surface. This also ensures that the paint doesn't chip.
- It is advised to let the paint dry for at least 5 minutes before turning the panel to the other side.
- If the first layer of paint didn't cover the panel entirely, you can spray a second coat of paint.

WARNINGS

- To keep things clean and tidy place an old newspaper or any kind of paper beneath the panel before spray painting it.
