

CHICKEN WIRE

Compost Bin

What You'll Need:

- Chicken wire
- T posts or wooden posts
- Cable ties or Staples
- Protective gloves
- Post driver or Sledgehammer
- Wire cutters
- Hammer
- Tape measure

1 Plan and Prepare

Plan the layout and prepare the site for your chicken wire compost bin.

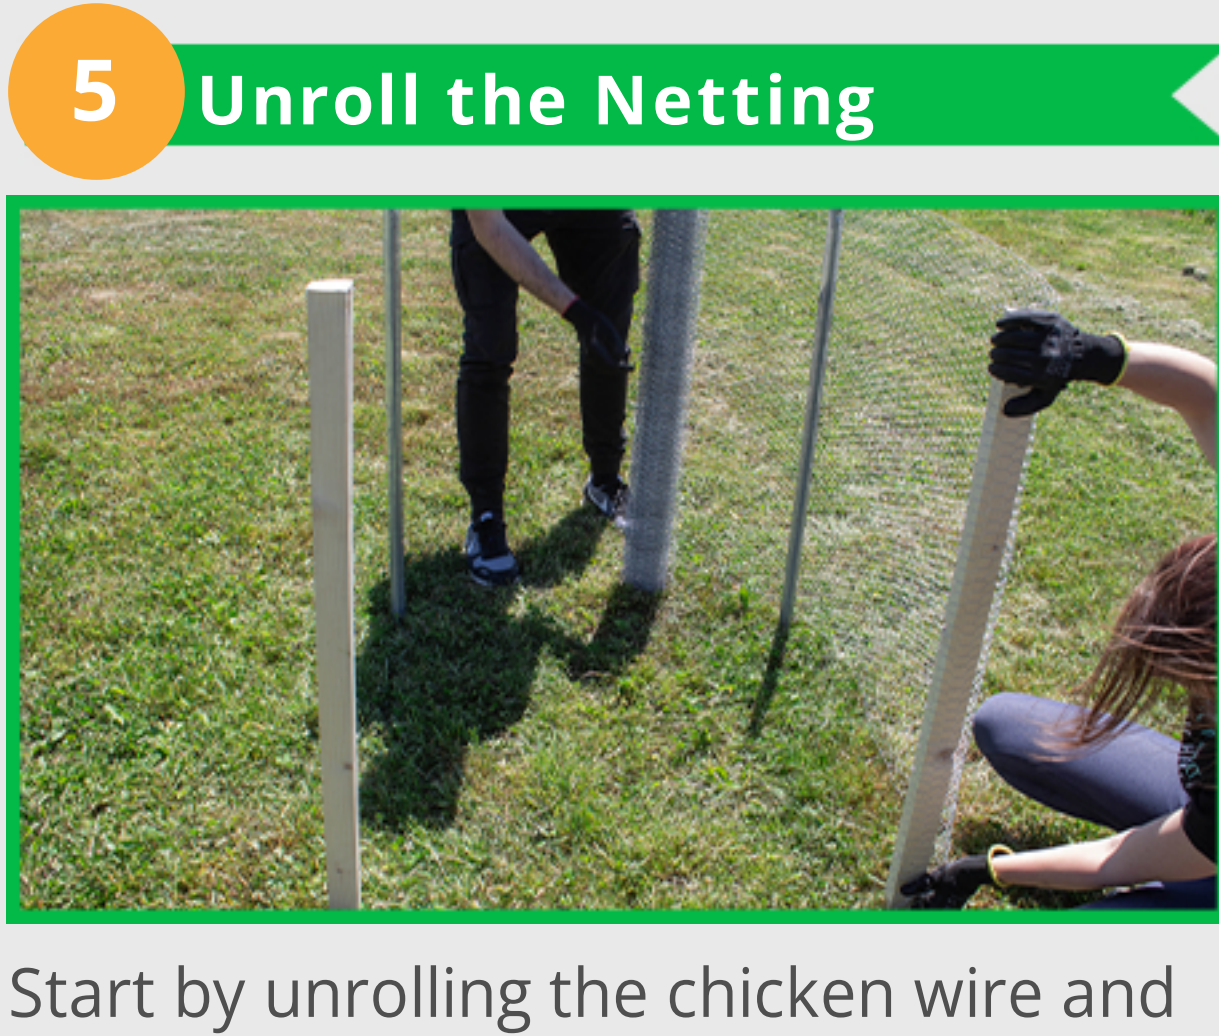

Position a post at each corner, leaving approximately 90-120 cm between the posts.

2 Start Installing Posts

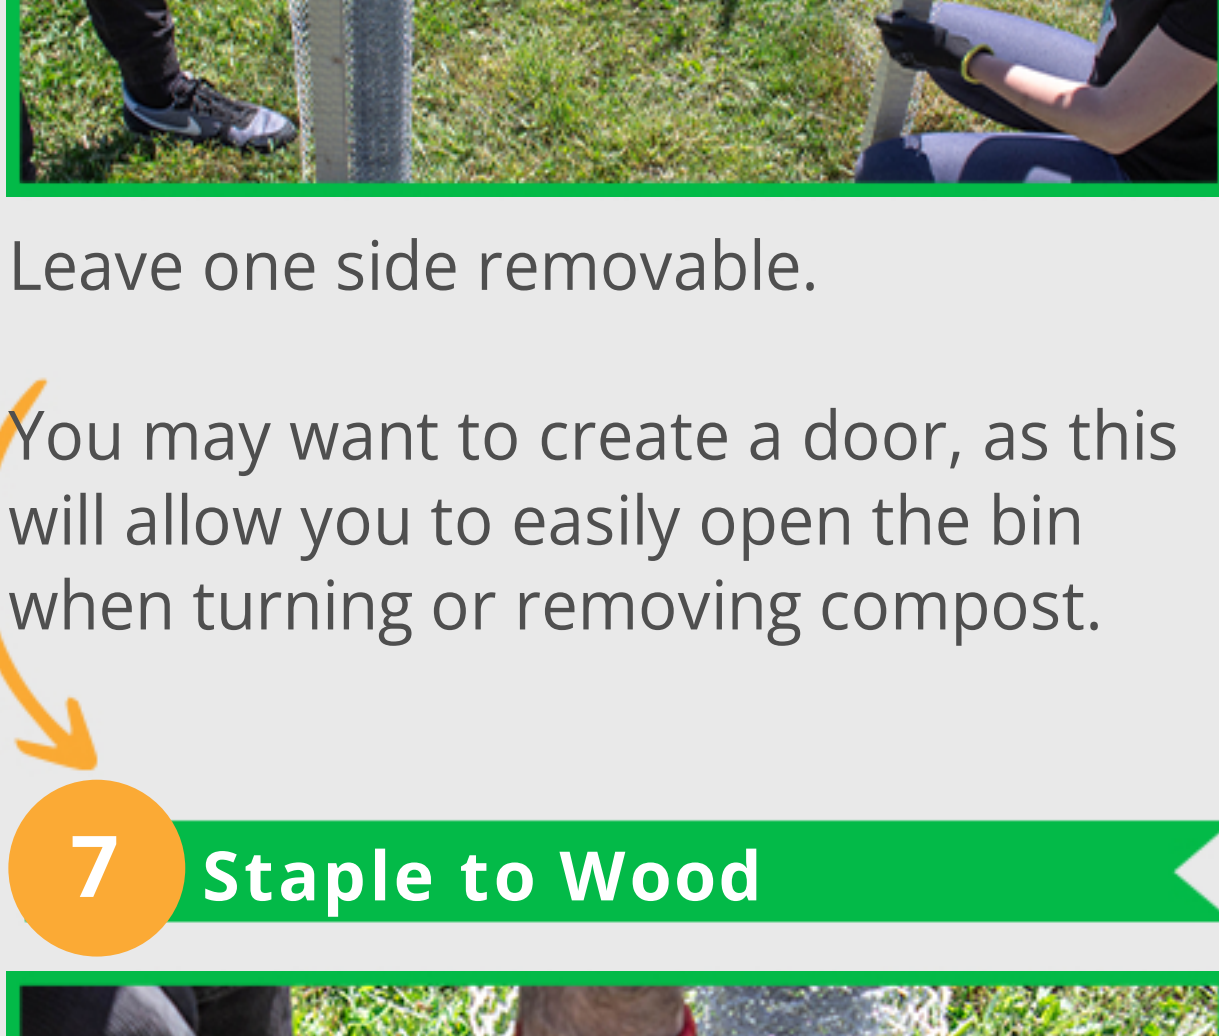

Start by installing your posts. If you are using T posts, drive them at least 30 cm into the ground to ensure they are stable.

3 Hammer Into the Ground

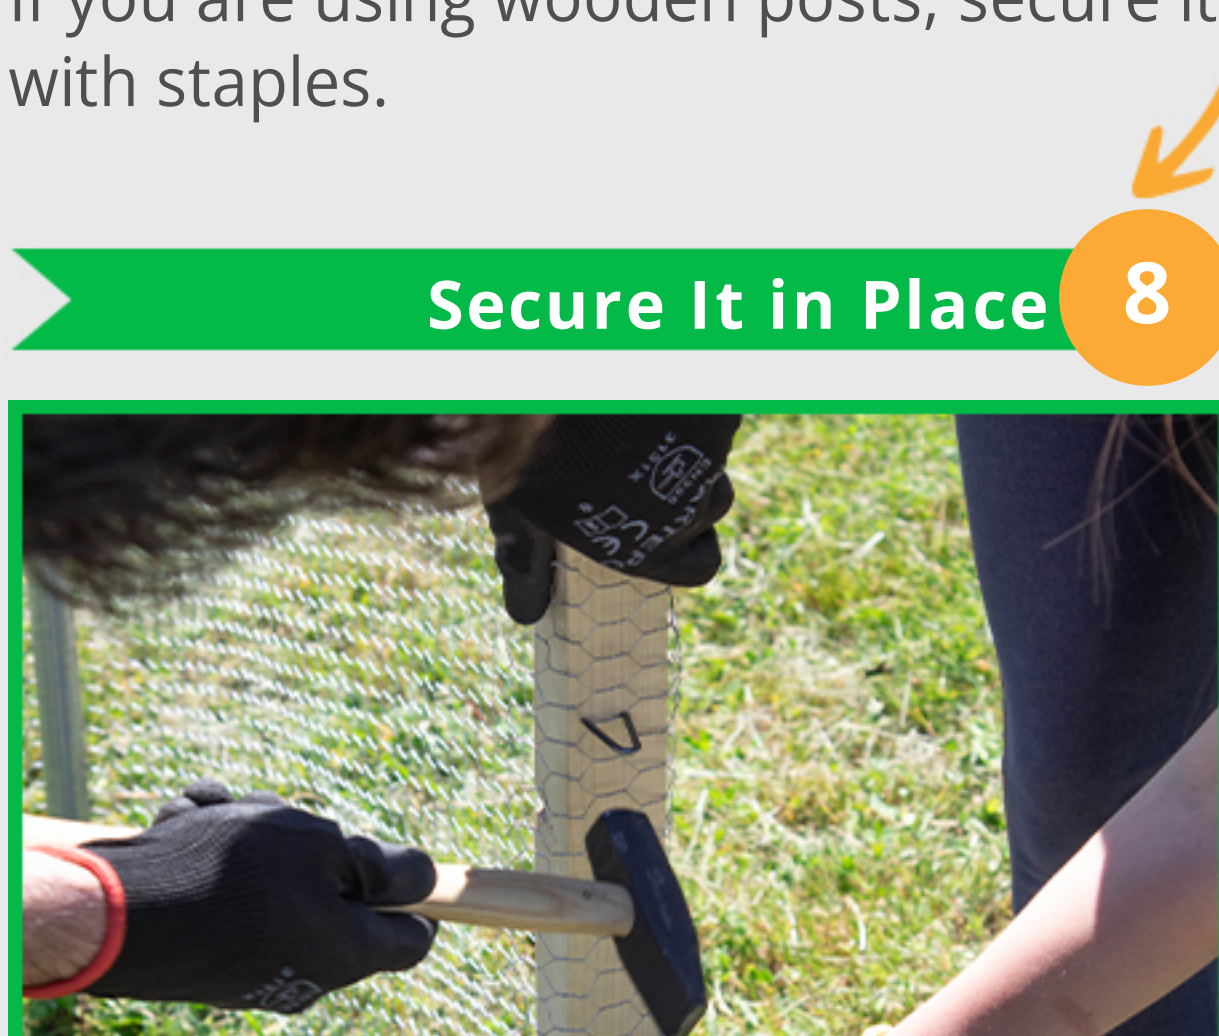

Alternatively, hammer the wooden posts into the ground until they are firmly secure.

4 Check Post Stability

Once the posts are installed, check that they are stable and firmly fixed in place.

5 Unroll the Netting

Start by unrolling the chicken wire and positioning it around the posts.

6 Make One Side Removable

Leave one side removable.

You may want to create a door, as this will allow you to easily open the bin when turning or removing compost.

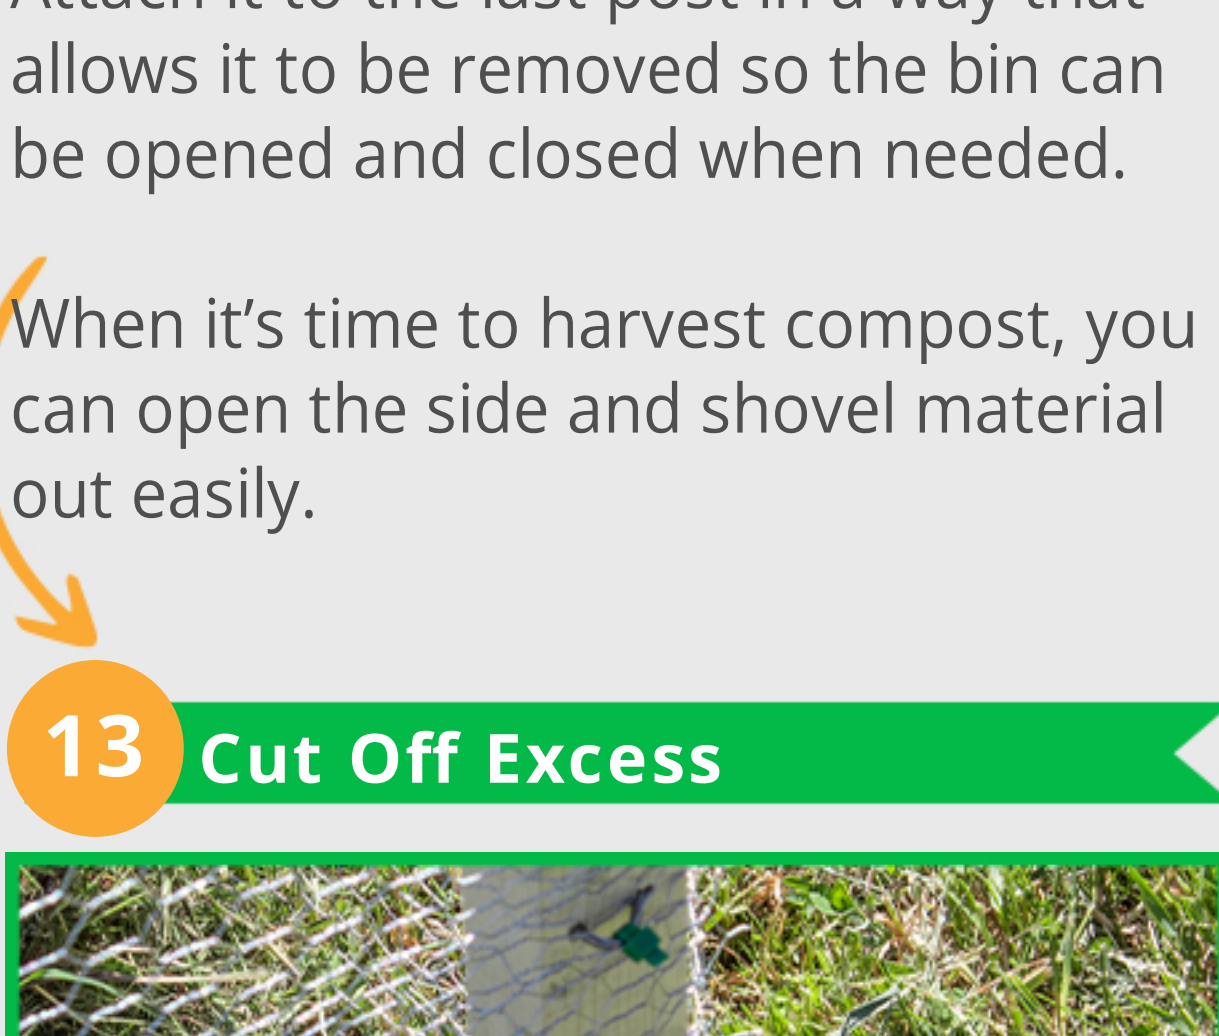

7 Staple to Wood

Then attach the chicken wire to the posts.

If you are using wooden posts, secure it with staples.

8 Secure It in Place

Then staple it to the post at the other end as well to secure it in place.

9 Secure with Cable Ties

If you are using metal or T posts, use cable ties to secure the netting in place.

10 Cut the Netting

Measure enough netting to reach the last post, making sure to account for the space needed for the door.

Cut off any excess netting once you have the correct length.

11 Close the Door

Close the removable side, which is also known as the door.

12 Secure the Door

Attach it to the last post in a way that allows it to be removed so the bin can be opened and closed when needed.

When it's time to harvest compost, you can open the side and shovel material out easily.

13 Cut Off Excess

Cut off any excess cable tie ends for a neat and tidy finish.

14 Finished Project

Your chicken wire compost bin is now ready to use, and you can start filling it with compostable materials.
